NAME

git−qnext − identify the next available pushable patch

SYNOPSIS

git qnext [**−v** | **−−verbose**] [**−s** | **−−summary**]

DESCRIPTION

The **git qnext** command displays the identity of the next available patch which is both unapplied and unguarded, if any, in a **Git−MQ** patch series, following the topmost applied patch, (or the first available patch in the series, if none have been applied); this is the patch, if any, which will become topmost, following a "**git qpush**" operation with no arguments specified.

OPTIONS

−s, **−−summary**

Include the summary line from the patch header, if available.

−v, **−−verbose**

Include the patch sequence number, and the status flag, (which should always be 'U'), as described for the **git qseries** command; also report any guarded patches which must be skipped, in order to reach the next pushable patch.

EXIT STATUS

On successful completion, **git qnext** reports an exit status code of 0, when an immediately pushable patch is identified, or of 1 if no pushable patches are available. Any other non-zero exit status code indicates that an error occurred.

COMPARISON WITH MERCURIAL QUEUES

Inspired by, and for the most part based on behavioural observation of **Mercurial**'s **MQ** extension, the **git qnext** command exhibits fundamentally the same behaviour as its **hg qnext** counterpart.
